Lesson 12: Analog Signal Conditioning

Lesson 12_et438b.pptx

1

Learning Objectives

After this presentation you will be able to:

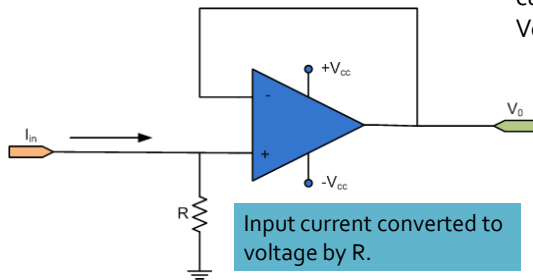

- Design a voltage-to-current interface for a transducer and simulate its operation using commonly available software
- List the modes of operation of a Wheatstone bridge circuit
- Explain how Wheatstone bridge resistor values effect linearity and sensitivity
- Design a signal conditioning circuit for a Wheatstone bridge.

Lesson 12_et438b.pptx

2

Analog-to-Analog Conversion Signal Conditioning

Current-to-Voltage Converter I-to-V Converter

Since $V^+ = V^-$

$$V_o = I_{in} \cdot R$$

Example: Find a value the value of R that converts a 4 mA to 20 mA current signal into a 1 – 5 V output Voltage.

$$V_o = I_{in} \cdot R \Rightarrow R = \frac{V_o}{I_{in}}$$

$$V_o = 1 \text{ V} @ I_{in} = 4 \text{ mA}$$

$$R = \frac{1 \text{ V}}{4 \text{ mA}} = 250 \Omega$$

Check output at 20 mA

$$V_o = 250 \Omega \cdot (20 \text{ mA}) = 5 \text{ V}$$

Lesson 12_et438b.pptx

3

Signal Conditioning

Voltage-to-Current Converter V-to-I Converter (Transconductance Amps)

Ungrounded load

$$V^+ = V^- = V_{in} \text{ and } I_{in} = 0$$

$$\text{So } I_o - I_R = 0 \text{ or } I_o = I_R$$

$$I_o = I_R = \frac{V^-}{R} \text{ but } V^- = V^+ = V_{in}$$

$$I_o = \frac{V_{in}}{R} \leftarrow$$

Note: $R_L < R$ for practical circuit operation. OP AMP output voltage determines magnitude of R_L for constant current

Lesson 12_et438b.pptx

4

Signal Conditioning Example

Convert a 0-5 V dc voltage signal to a 4-20 mA current signal using OP AMP circuits.

Determine the ratio of spans

$$R6 = \frac{V_{in}}{I_0} = \frac{V_{in(max)} - V_{in(min)}}{I_{0max} - I_{0min}} = \frac{5\text{ V} - 0\text{ V}}{20\text{ mA} - 4\text{ mA}} = \frac{5\text{ V}}{16\text{ mA}} = 312.5\ \Omega$$

Lesson 12_et438b.pptx

5

Signal Conditioning Example

Compute the value of Vbias to give the value of minimum output current

Check the output with
 $V_{in} = 5\text{ V}$

What is max value of R_L ?
Assume $V_{sat} = 10.5\text{ V}$

$$I_{0min} = 4\text{ mA}$$

$$I_0 = \frac{V_{in}}{R} \Rightarrow I_0 \cdot R = V_{in}$$

$$V_{bias} = I_{0min} \cdot R$$

$$R = 312.5\ \Omega$$

$$V_{bias} = (4\text{ mA}) \cdot (312.5\ \Omega)$$

$$V_{bias} = 1.25\text{ V}$$

$$I_0 = \frac{V_{in}}{R}$$

$$V_{max} = V_{in(max)} + V_{bias}$$

$$V_{max} = 5\text{ V} + 1.25\text{ V}$$

$$I_0 = \frac{6.25\text{ V}}{312.5\ \Omega}$$

$$I_0 = 0.02\text{ A} = 20\text{ mA}$$

$$R_{L(max)} = \frac{V_{sat} - V_{in(max)}}{I_{0max}}$$

$$V_{sat} = 10.5\text{ V}$$

$$I_{0max} = 0.020\text{ A} = 20\text{ mA}$$

$$V_{in(max)} = 6.25\text{ V}$$

$$R_{L(max)} = \frac{10.5\text{ V} - 6.25\text{ V}}{0.02\text{ A}} = 212.5\ \Omega$$

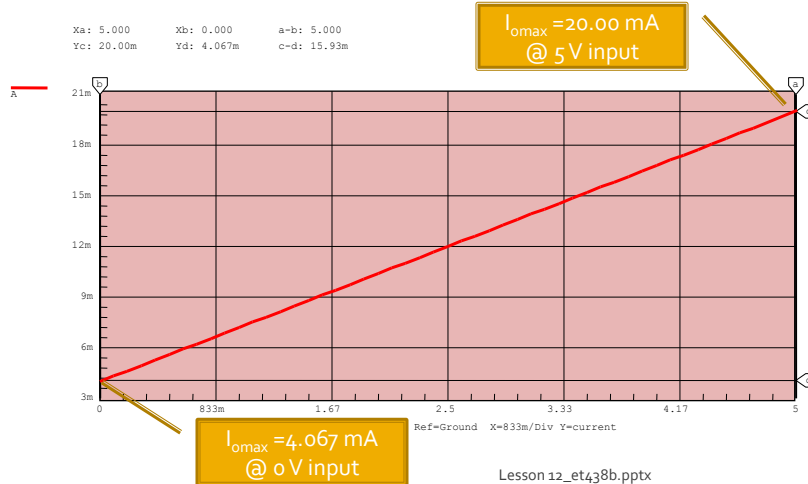

Assumes OP AMP has sufficient current output

Lesson 12_et438b.pptx

6

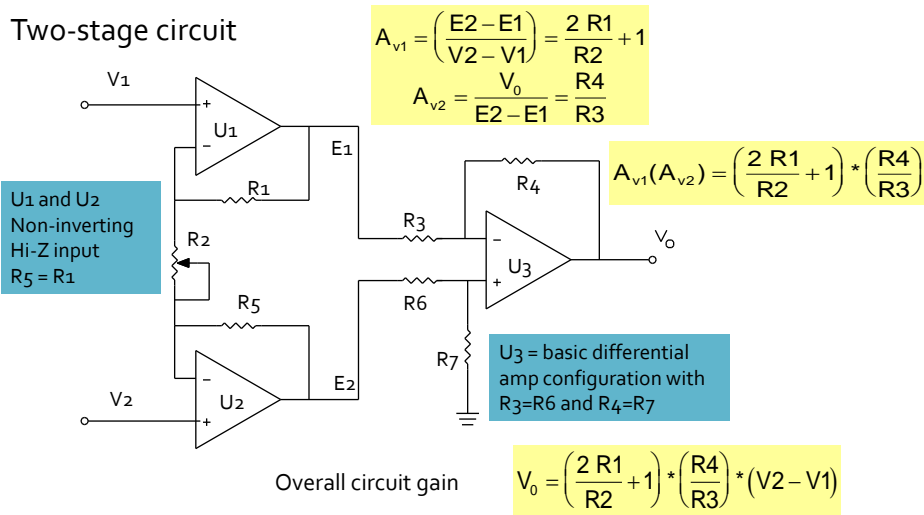

Circuit Simulation of Example: Dc Sweep

Output Current Vs Input Voltage

Instrumentation Amps with High Impedance Input

Two-stage circuit

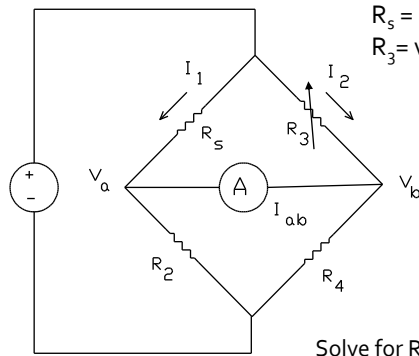

Lesson 12_et438b.pptx

8

Signal Conditioning-Bridge Circuits

Dc bridges (Wheatstone bridges) Used to detect small resistance changes in sensors. Typically used with sensors that measure force, temperature, and pressure.

R_s = sensor R

R_3 = variable resistor used to balance bridge

When bridge is balanced:

$$I_{ab} = 0 \text{ since } V_a = V_b$$

$$\text{so } I_1 R_s = I_2 R_3 \text{ and } I_1 R_2 = I_2 R_4$$

$$\frac{R_s}{R_2} = \frac{R_3}{R_4}$$

$$R_s = \frac{R_3}{R_4} R_2 \quad \text{Adjust } R_3 \text{ until } I_{ab} = 0 \text{ compute } R_s$$

Solve for R_s

Lesson 12_et438b.pptx

9

Bridge Use Methods

There are two operating modes for a dc bridge: balanced (null) and unbalanced

Null Mode - adjust R_3 variable resistor until $I_{ab} = 0$. Need automatic nulling circuit for automatic operation.

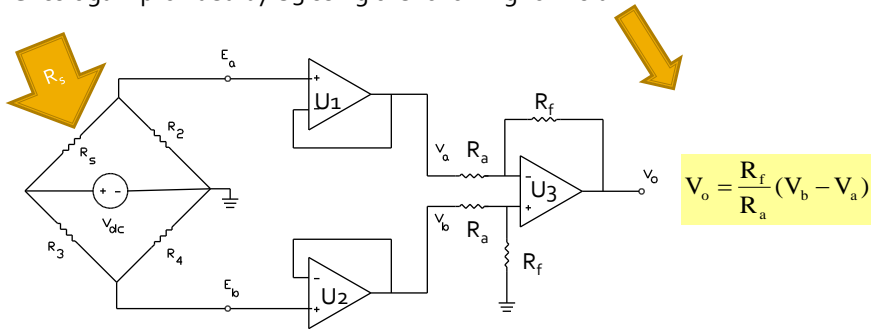

Unbalanced Mode - insert sensor and null bridge for sensor measurement. When initial value of sensor changes measure difference in voltage. Bridge only balanced at one point

Lesson 12_et438b.pptx

10

Unbalanced Bridge Operation

Note the unbalanced bridge shown below. U1 and U2 provide high-Z input. Circuit gain provided by U3 using the following formula.

Find expression for bridge equation. in terms of the change in sensor resistance R_s .

Lesson 12_et438b.pptx

11

Unbalanced Bridge Analysis

Bridge Circuit

Find the voltage V_{ba} in terms of the resistors

$$V_a = \left(\frac{R_2}{R_s + R_2} \right) \cdot V_{dc}$$

$$V_b = \left(\frac{R_4}{R_3 + R_4} \right) \cdot V_{dc}$$

$$V_b - V_a = \left(\frac{R_4}{R_3 + R_4} - \frac{R_2}{R_s + R_2} \right) \cdot V_{dc}$$

$$R_{bal} = \frac{R_2 R_3}{R_4}$$

Normalize V_{ba} by dividing by supply V.
Find common denominator

$$\frac{V_b - V_a}{V_{dc}} = \left(\frac{R_4}{R_3 + R_4} - \frac{R_2}{R_s + R_2} \right) = \frac{R_4(R_s + R_2) - R_2(R_3 + R_4)}{(R_3 + R_4)(R_s + R_2)}$$

Lesson 12_et438b.pptx

12

Unbalanced Bridge Analysis

Bridge Analysis (Continued)

Expand terms and simplify

$$\frac{V_b - V_a}{V_{dc}} = \frac{R_4 R_s + \cancel{R_4 R_2} - R_2 R_3 - \cancel{R_2 R_4}}{(R_3 + R_4)(R_s + R_2)} = \frac{R_4 R_s - R_2 R_3}{(R_3 + R_4)(R_s + R_2)}$$

From the previous balance equation

$$\frac{R_{bal} R_4}{R_3} = R_2$$

Substitute these equations into the above relationship

$$\frac{V_b - V_a}{V_{dc}} = \frac{R_4 R_s - R_{bal} R_4}{(R_3 + R_4)(R_s + R_{bal} R_4 / R_3)} \leftarrow$$

$$(R_3 + R_4)(R_s + R_{bal} R_4 / R_3) = R_3 R_s + R_4 R_s + R_{bal} R_4 + R_{bal} R_4^2 / R_3$$

Lesson 12_et438b.pptx

13

Unbalanced Bridge Analysis

Bridge Analysis (Continued)

Combine the past two equations and clear R_3 from the denominator.

$$\frac{V_b - V_a}{V_{dc}} = \frac{R_3 R_4 (R_s - R_{bal})}{R_3^2 R_s + R_3 R_4 R_s + R_3 R_4 R_{bal} + R_{bal} R_4^2}$$

Now let $R_4 = R_3$ and simplify further

$$\frac{V_b - V_a}{V_{dc}} = \frac{R_3^2 (R_s - R_{bal})}{R_3^2 (2(R_s + R_{bal}))} = \frac{R_3^2 (R_s - R_{bal})}{R_3^2 R_s + R_3^2 R_s + R_3^2 R_{bal} + R_{bal} R_3^2}$$

$$\frac{V_b - V_a}{V_{dc}} = \frac{R_3^2 (R_s - R_{bal})}{2R_3^2 R_s + 2R_3^2 R_{bal}} = \frac{R_3^2 (R_s - R_{bal})}{R_3^2 (2(R_s + R_{bal}))}$$

$$\frac{V_b - V_a}{V_{dc}} = \frac{(R_s - R_{bal})}{2(R_s + R_{bal})} \leftarrow \text{Desired Relationship}$$

Lesson 12_et438b.pptx

14

Unbalanced Bridge Analysis

Equation below relates the output voltage change (per volt of supply V) to the change in sensor resistance.

$$\frac{V_b - V_a}{V_{dc}} = \frac{(R_s - R_{bal})}{2(R_s + R_{bal})}$$

When $R_3 = R_4$

Original Bridge

Determine the output voltage linearity compared to the sensor resistance change.

Lesson 12_et438b.pptx

15

Bridge Output Linearity Analysis

Example: An unbalanced bridge circuit converts temperature sensor resistance into a differential voltage that is amplified by a instrumentation amplifier. The temperature sensor has a resistance of 120 ohms at 35 C and a resistance range of 90 to 150 ohms.

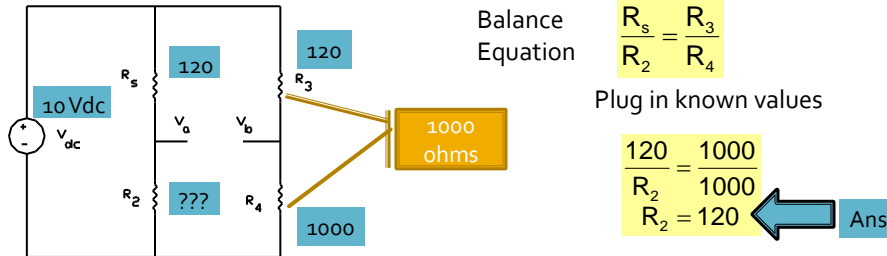

- 1.) Design a dc bridge circuit with a 10 V supply that will give zero output at 35 C.
 - a.) Using $R_3 = R_4 = 1000$ ohms
 - b.) Using $R_3 = 120$, $R_4 = 1000$ ohms
- 2.) Plot the output voltage over the range of operation at 5 ohm increments for both designs a.) $R_3 = R_4 = 1000$ ohms b.) $R_3 = 120$ and $R_4 = 1000$ ohms
- 3.) Find the zero based linear approximation of the bridge output responses.
- 4.) Determine the maximum non-linearity for each case
- 5.) Determine the gain required for the instrumentation amplifier gain if a span of 15 V dc is required.

Lesson 12_et438b.pptx

16

Bridge Output Linearity Analysis

Example Solution (Part 1a) Balance bridge with $R_3=R_4=1000$ ohms

Example Solution (Part 1b) Balance bridge with $R_3=120$ ohms $R_4=1000$ ohms

$$\frac{R_s}{R_2} = \frac{R_3}{R_4}$$

$$\frac{120}{R_2} = \frac{120}{1000}$$

$$R_2 = 1000 \quad \text{Ans}$$

Lesson 12_et438b.pptx

17

Bridge Output Linearity Analysis

Example Solution (Part 2a) plot output V with $R_3=R_4=1000$ ohms

$$V_b - V_a = \frac{(R_s - R_{bal})}{2(R_s + R_{bal})} V_{dc}$$

$$R_{bal} = \frac{R_2 R_4}{R_3} = \frac{120(1000)}{1000} = 120 \quad R_{bal} = 120$$

Plot values of R_s from 90 to 150 with Excel or MathCAD using the equation below

$$V_d = V_b - V_a = \frac{(R_s - 120)}{2(R_s + 120)} 10$$

Sample calculation
 $R_s = 90$ ohms

$$V_d = \left[\frac{(90\Omega - 120\Omega)}{2(90\Omega + 120\Omega)} \right] \cdot 10V$$

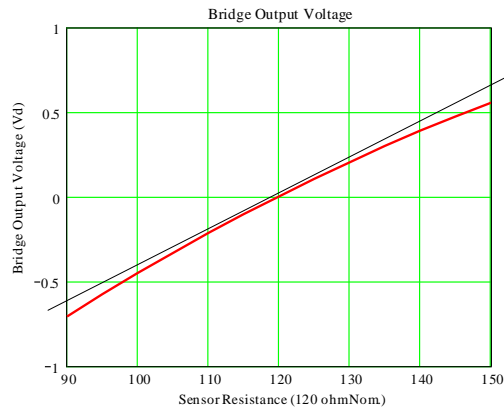

$$V_d = -0.714V$$

Lesson 12_et438b.pptx

18

Output Plot $R_3=R_4=1000\text{ Ohms}$

| $r_s =$ | $V_d(r_s) =$ |
|-------------|--------------|
| 90 Ω | -0.714 V |
| 95 | -0.581 |
| 100 | -0.455 |
| 105 | -0.333 |
| 110 | -0.217 |
| 115 | -0.106 |
| 120 | 0 |
| 125 | 0.102 |
| 130 | 0.2 |

| 145 | 0.472 |
| 150 | 0.556 |

Non-linear output

Lesson 12_et438b.pptx

19

Linearity With R_3 Not Equal to R_4

Example Solution (Part 2b) plot output V with $R_3=120\text{ }R_4=1000\text{ ohms}$

Use the alternative formula written as function of r_s , sensor resistance

$$V_{d1}(r_s) = \left[\frac{R_4(r_s - R_{bal})}{(R_3 + R_4) \left(r_s + \frac{R_{bal} \cdot R_4}{R_3} \right)} \right] \cdot V_{dc}$$

$$\text{Where } R_{bal} = \frac{R_2 \cdot R_3}{R_4} = \frac{(1000\Omega)(120\Omega)}{1000\Omega} = 120\Omega$$

$$\text{Substitute Values } V_d(r_s) := \frac{(1000\Omega) \cdot (r_s - 120\Omega) \cdot 10\text{ V}}{(1120\Omega) \cdot (r_s + 1000\Omega)} \quad V_{d1} = \frac{(1000\Omega) \cdot (90\Omega - 120\Omega) \cdot 10\text{ V}}{(1120\Omega) \cdot (90\Omega + 1000\Omega)}$$

Sample Calculation

$$V_{d1} = -0.246\text{V}$$

Lesson 12_et438b.pptx

20

Output Plot $R_3 = 120$ and $R_4 = 1000$ Ohms

| $V_d(r_s) =$ | $r_s =$ |
|--------------|---------|
| -0.246 | 90 |
| -0.204 | 95 |
| -0.162 | 100 |
| -0.121 | 105 |
| -0.08 | 110 |
| -0.04 | 115 |
| 0 | 120 |
| 0.04 | 125 |
| 0.079 | 130 |
| 0.118 | 135 |
| 0.157 | 140 |
| 0.195 | 145 |
| 0.233 | 150 |

Less output voltage than first case

Lesson 12_et438b.pptx

21

Linear Approximations

Example Solution (Part 3) Find zero based linear approximation. Assume line passes through zero and the average of the end points

For bridge with $R_3=R_4=1000$ ohms

$$\text{at } R_s = 90 \quad V_d = -0.714$$

$$\text{at } R_s = 150 \quad V_d = 0.556$$

$$\text{Average max value } (|-0.714| + |0.556|)/2 = 0.635$$

Use two data points: $R_{s1}=120 \quad V_{d1} = 0$
 $R_{s2}=150 \quad V_{d2}=V_{ave} = 0.635$

Use two-point
form of line to
find equation

$$(V_d - V_{d1}) = \frac{(V_{d2} - V_{d1})}{(R_{s2} - R_{s1})}(r_s - R_{s1})$$

$$(V_d - 0) = \frac{(0.635 - 0)}{(150 - 120)}(r_s - 120)$$

$$V_d = 0.021167r_s - 2.54$$

Equation

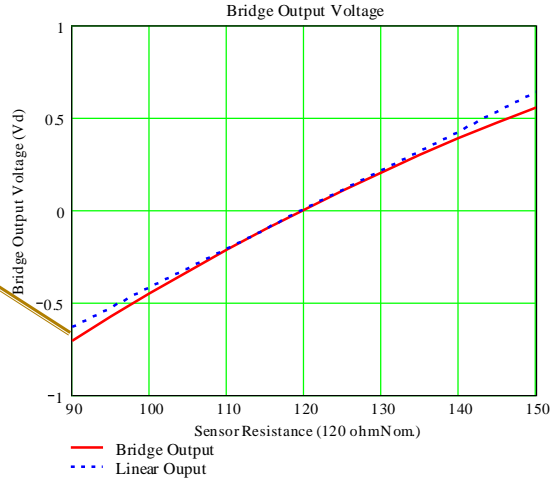

Lesson 12_et438b.pptx

22

Linear Approximations

For bridge with $R_3=R_4=1000$ ohms

Non-linearity
Increase as
 R_s moves from
balance point

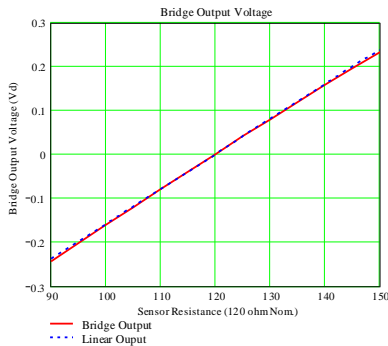

Lesson 12_et438b.pptx

23

Linear Approximations

For bridge with $R_3=120, R_4=1000$ ohms
 at $R_{s1}=90$ $V_{d1} = -0.246$
 at $R_{s2}=150$ $V_{d2} = 0.233$

Average max value $(|-0.246|+|0.233|)/2 = 0.2395$

$$(V_d - V_{d1}) = \frac{(V_{d2} - V_{d1})}{(R_2 - R_1)} (r_s - R_1)$$

$$(V_d - 0) = \frac{(0.2395 - 0)}{(150 - 120)} (r_s - 120)$$

$$V_d = 0.007983r_s - 0.958$$

Equation

Less output voltage but greater linearity
 Dc bridge approximately linear for small
 deviations around balance point

Lesson 12_et438b.pptx

24

Maximum Non-Linearity

Example Solution (Part 4) Determine the maximum non-linearity for each bridge.

Take difference between actual bridge output and the zero based lines.
Maximum occurs at either end of the graph.

| $V_d(r_s) =$ | $V_{dl}(r_s) =$ | $ V_{dl}(r_s) - V_d(r_s) $ | $V_{dl}(r_s) =$ | $V_{dl}(r_s) =$ | $ V_{dl}(r_s) - V_d(r_s) $ |
|--------------|-----------------|----------------------------|-----------------|-----------------|----------------------------|
| -0.714 V | -0.635 V | 0.0793 V | -0.246 V | -0.24 V | 0.0062 V |

| 0.556 | 0.635 | 0.0795 | 0.233 | 0.239 | 0.0065 |

$R_3 = 1000 \Omega$
 $R_4 = 1000 \Omega$

$R_3 = 120 \Omega$
 $R_4 = 1000 \Omega$

Bridge Linearized

Lesson 12_et438b.pptx

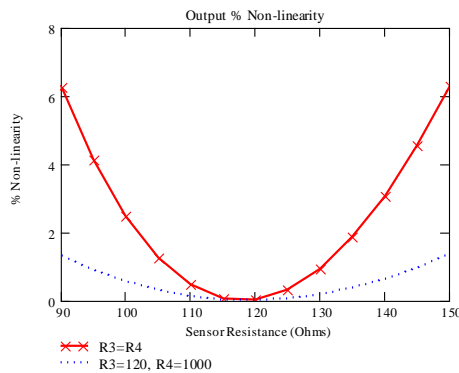

25

Percent Non-Linearity

Determine the percent non-linearity using the following formula

$$\% \text{ error} = \frac{|V_{dl} - V_d|}{|2 \cdot V_{dl(\text{max})}|} \cdot 100\%$$

Where $V_{dl(\text{max})} = \text{max linear output}$

Non-linearity greatly improved by making R_3 equal to nominal resistive sensor value

Lesson 12_et438b.pptx

26

Instrumentation Amplifier Gains

Example Solution (Part 5) Determine the gain necessary for a span of 15 Vdc

Use average value of V_d to compute gain

For $R_3 = R_4 = 1000$ ohms

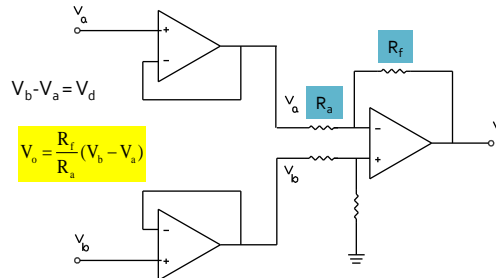

Average max value

$$(|-0.714| + |0.556|) / 2 = \mathbf{0.635 \text{ V}}$$

For $R_3 = 120$ and $R_4 = 1000$ ohms

Average max value

$$(|-0.246| + |0.233|) / 2 = \mathbf{0.2395 \text{ V}}$$

Lesson 12_et438b.pptx

27

Instrumentation Amplifier Gains

Compute the Amp gains using the gain formula

For $R_3 = R_4 = 1000$ ohms

$$V_0 = 15 \text{ V dc } V_d = 0.635 \text{ V}$$

$$\frac{V_0}{V_d} = \frac{R_f}{R_a} = A_v$$

$$\frac{15 \text{ V}}{0.635 \text{ V}} = \frac{R_f}{R_a} = A_v$$

$$23.62 = A_v$$

For $R_3 = 120$ and $R_4 = 1000$ ohms

$$V_0 = 15 \text{ V dc } V_d = 0.2395 \text{ V}$$

$$\frac{V_0}{V_d} = \frac{R_f}{R_a} = A_v$$

$$\frac{15 \text{ V}}{0.2395 \text{ V}} = \frac{R_f}{R_a} = A_v$$

$$62.63 = A_v$$

Note that increasing linearity reduces V_d and requires higher gains

Lesson 12_et438b.pptx

28
